THE REPORT FOR INVESTIGATION WORKS FOR THE CONSTRUCTION OF REGULATOR ACROSS KADALUNDI RIVER AT MOOZHIKKAL KADAVU NEAR PALATHINGAL BETWEEN TIRURANGADI MUNICIPALITY AND MOONNIYUR PANCHAYATH

It is proposed to construct a regulator across Kadalundi river at Moozhikkal Kadavu near Palathingal bride. In order to find the suitable footing/Ground condition of proposed project geotechnical investigation was conducted. Analysis done at the site through 10 numbers of bore holes was taken along the proposed alignment of new regulator. Also total station surveying of proposed project was conducted. The new proposed regulator will help Thirurangadi municipality and Moonniyur panchayath people. Proposed regulator formation level will be 4.5 meter from the ground level.

INVESTIGATIONWORKS FOR THE CONSTRUCTION REGULATORACROSSKADALUNDIRIVER AT MOOZHIKKALKADAVUNEAR PALATHINGAL BETWEEN TIRURANGADI MUNICIPALITY AND MOONNIYUR PANCHAYATH

To
The Executive Engineer,
Minor Irrigation Division,
Malapuuram-676505

SUB: GEOTECHNICAL INVESTIGATION REPORT

Respected Sir,

We are pleased to submit to you our soil investigation report on the sub soil exploration, field, laboratory investigation and geotechnical recommendation for the construction of regulator across Kadalundi river at Moozhikkal Kadavu near Palathingal between Thirurangadi Municipality and Moonniyur Panchayath, Malappuram .The purpose of the exploration was to evaluate the general subsoil conditions within the proposed site. This report presents our findings, conclusions and recommendations for the selection of foundation as well as construction considerations for the proposed foundation.

M/s Geo Structura appreciates the opportunity to assist you during this phase of the project. If you have any queries concerning this report, or if you need any further assistance, please contact us. We look forward to our continued relationship.

Respectfully submitted,

Geo Structura Geotechnical Engineer

1.0 INTRODUCTION

A bridge is a structure built to span a physical obstacle, such as a body of water, valley, or road, without closing the way underneath. It is constructed for the purpose of providing passage over the obstacle, usually something that can be detrimental to cross otherwise. The soil investigation work carried out for the construction of regulator across Kalandi river at Moozhikkal Kadavu near Palathingal between Thirurangadi Municipality and Moonniyur Panchayath, Malappuram.

1.1 PURPOSE & SCOPE

Geo structura geotechnical lab, Kuchand this geotechnical report for the design and construction of construction of regulator across Kalandi river at Moozhikkal Kadavu near Palathingal between Thirurangadi Municipality and Moonniyur Panchayath, Malappuram. We prepared this report as outlined in agreement to Mr Jamshad Naseeri, he authorized Geo structura geotechnical lab, Kollam to conduct the scope of services outlined below.

- Service plan development
- Reconnaissance
- Sub surface exploration
- Soil laboratory testing
- Total station surveying
- Data analysis and conclusions
- Report preparation

This report was prepared for the exclusive use of concerned government authorities for the further evaluation and design of project.

1.2 FIELD INVESTIGATION

The field investigation consists of the following methods

- Mobilization including transportation of all necessary plant and equipment and materials of boring, field and sampling, demobilization after completing the work and personals.
- Setting up of **10 Number**bore holes.
- Boring / drilling up to 50m or depth where hard strata available below N.G.L or refusal.
- Conducting standard penetration test (SPT) & collection of disturbed sample (DS) at the locations prefixed by the Engineer-in-charge.
- Observation of the depth of water table in the borehole.
- Study of site condition and surroundings with regards to the need of the project.
- Taking observation of surrounding structure to observe any deficiency in safety.
- Transportation of all soil samples to laboratory for analysis with proper care.

1.3 LABORATORY TESTS:

The Laboratory tests for the sample collected are given below

- Grain size analysis
- Soil moisture content
- Liquid limit ,Plastic limit
- Specific gravity ,Shear strength
- Preparation and submission of a technical report containing the details of the tests carried out, their analysis and recommendations regarding the economical and best foundation type to be adopted. Three copies of the report are to be submitted.

1.3 PROJECT LOCATION

Fig 1.1 and 1.2 displays the site location of proposed site .

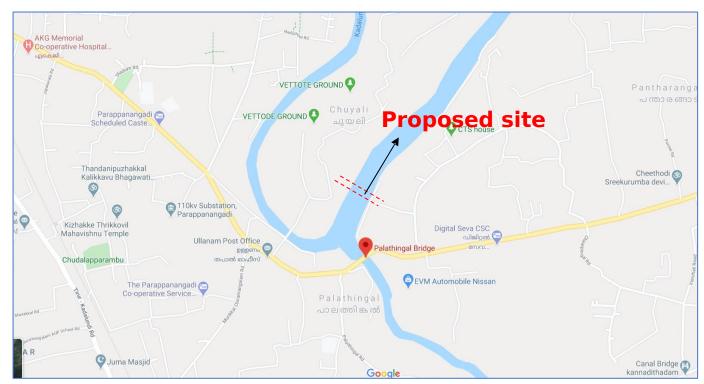

Fig 1.1 Site location

1.4 PROJECT DESCRIPTION

The proposed project includes the construction of regulator across Kadalundi river at Moozhikkal Kadavu near Palathingal between Thirurangadi municipality and Moonniyur panchayath, Malappuram. In order to find the suitable footing/ground condition of proposed project geotechnical investigation was conducted. Analysis done at the site through 10 numbers of bore holes at various remote points across river. Bore holes 1 and 10 was taken at each land portion of River (Total 2 Nos), 2.3,4, 5,6,7,8 and bore holes was taken in the river. Also total station surveying of proposed project was conducted.

2.0 FINDINGS

2.1 RECCONAISSANCE

2.1.1 GEOLOGY

According to district survey report, Malappuram District, Kerala State, In the proposed project area contain riverine alluvium. Riverine alluvium is very deep with sandy loam to clayey loam texture. The riverine alluvium contains moderate organic matter, nitrogen, phosphorous and potash.

Malappuram district is mainly drained by the Kadalundi River, Chaliyar River and Bharathappuzha (locally known as Ponnani River). Of these rivers, only Chaliyar and Bharathappuzha are perennial and all others get dried up in summer and hence Malappuram district is drought prone. The Kadalundi River is formed by the confluence of its two main tributaries viz; the Olipuzha and the Veliyar. The Kadalundi River is 130 km long with a drainage area of 1274 sq. km. The river joins the Lakshadweep Sea at about 5 km south of the Chaliyar river mouth.

The drainage pattern of the three rivers in the district is generally dendritic. Tidal effects are experienced in places such as Vallikkunnu and Tirurangadi, which are 10km and 25km away from the coast. Analysis of the drainage characteristics of the two basins reveals that Kadalundi river is a fourth order stream, the Ponnani river is fifth order stream and the Chaliyar river is a seventh order stream.

2.1.2 SURFACE CONDITIONS

Riverine alluvium and Lateritic loam was found at the surface. Grass land, medium high trees and bushes at the banks of river.

According to site plan provided by Compass Surveyors ,Malappuram. Reduced levels shown are based on assuming bench mark elevation 7.654 m.

Following site features observed during renaissance and field Photography review

- The proposed regulator bridge has to be constructed across Kadalundi river near Moozhikkal Kadavu near Palathingal between Thirurangadi municipality and Moonniyur panchayath, Malappuram.
- Water level in the river is less and RL was -1.600m

2.2 SOIL EXPLORATION

Our field exploration included rotary drilling through 10 borings cross the river width on site. We performed field exploration on December 2019 to February 2020. The location and elevations of our explorations are approximate and were determined using total station survey.

Following describes soil exploration techniques used in the project.

2.2.1 SELECTION OF BOREHOLE

10 bore-holes was selected by the Engineer in charge in order to obtain comprehensive subsoil data for this site with a provision of borings up to 50.0 m depth as required as per IS:1892 - 1979. A Schematic site plan showing the location of the test points marked by the client is given in appendix A. For detailed laboratory investigation, SPT is conducted at 1.0 m intervals or at change of soil strata in different Boreholes and S.P.T soil samples were collected for laboratory analysis. Disturbed representative, soil samples from all the boreholes were collected at 1.0 m. interval for different tests.

10 no's of 100 mm diameter bore holes are drilled using heavy duty calyx drilling rigs with direct mud circulation i.e wash boring for soil other than Rocks. Standard penetration tests (SPT) are done as per IS 2131 1963, the SPT value, viz (N values) are recorded in the bore log charts are accompanying this report. The soil samples are recovered using split spoon sampler are classified and tested in the laboratory. These lab investigations are included in this report.

2.2.2 BORING

Observed drilling of 10 borings and logged the subsurface conditions at each location. Boring locations are shown on site plan. Borings were advanced mechanically by rotary power drilling equipment using tungsten carbide bit (TC) in soft strata and power operated mechanical boring in hard strata using diamond cutter, as per IS: 1892 – 1979.

Borings were backfilled with drill cuttings. Rotary drilling is the most rapid method of advancing the boreholes in any type of soil. This method uses rotation of drill bits (tungsten), with the simultaneous application of pressure to advance the borehole.

In core drilling, an annular bit, fixed to the bottom of the outer rotating tube of a core barrel, cuts a core, which is recovered within the inner-most tube of the core barrel assembly and brought to the surface for examination and testing. The core is prevented from dropping out of the core barrel

by a core catcher made of spring steel and located just above the core bit. The boring/drilling works at the proposed locations identified and marked by client's representative were performed by the hydraulic rotary drilling rig. Rotary drilling operations were performed to obtain the best possible recovery of rock cores and disturbed soil samples in the boreholes. Disturbed soil samples were obtained through a split spoon sampler during execution of Standard Penetration Tests (SPT).

The test consists of dropping of a hammer of mass 63.5 kg on to a drive head from a height of 750 mm. The number of such blows (N) necessary to achieve a penetration of the split spoon sampler by 300 mm is regarded as the penetration resistance. The blow counts for each 150 mm penetration were recorded. Small, disturbed samples of soil were obtained from the split spoon sampler after completion of the tests.

On reaching the rock, the rock core samples were obtained through double tube core barrels. The quantitative description of natural fracture state of rock masses is indicated by means of total core recovery (TCR) and rock quality designation (RQD) as determined from the borehole cores.

TCR is the percentage ratio of core recovered (whether solid, intact with full diameter, or non-intact) to the total length of core run.

RQD is a quantitative index based on core recovery procedure that incorporates only those pieces of core which are 100mm or more in length. It is the total length of solid core pieces, each greater than 100mm between natural fractures, expressed as a percentage of the total length of core run.

2.2.3 STANDARD PENETRATION TESTS

Standard penetration test plays a major role in sub soil investigation termination of safe bearing capacity of soil in non-cohesive type soil, particularly in non-cohesive granular sandy soil and where the UDS could not be collected either due to high liquidity or non-cohesive nature of soil .The SPT tests were conducted as per IS: 2131-1981 respectively.

The SPT sampler was lower inside the borehole after drilling the required level and is driven by a 63.50 kg Rammer with a free fall of 750 mm. driving 450 mm in One stages 150 mm each and the number of blows for each 150mm penetration for 2nd & 3rd 150 mm drive recorded as "N". Refusal was considered for N>100. The details of location of test and SPT value [N] are presented in bore log data annexed separately.

Table 2.1 Summary of Field Work executed for the Project

SL	Bore Hole N	In-situ Test	=	Field Activity Dates

2.3 SUMMARY OF EXPLORATION OF BOREHOLES

A total of 10 borings were drilled during the exploration. The locations and graphical logs of these borings are shown on respectively, in Appendix A.

All borings were performed at the original planned locations of the proposed regulator bridge. 163 sample and 10 rock core borings were drilled at each of the bore locations, contour map were drawn to the assessment of drilling program. This map is presented in the report. During the drilling process in soils, attention was given to the description and consistency of the soils encountered. Soils were identified in terms of classification, colour, grain size, consistency, and moisture content. The location of the groundwater table was also noted on the logs, Because of the size of check dam and the loads to which it could be subjected, rock bearing foundations are anticipated for substructure support. As an indication of general competency of the rock cored, the Core recovery (CR) of each coring run was recorded. A complete listing of the CR values recorded for the borings is presented in Table 2.4

2.5 GROUND WATER CONDITIONS

Soil investigation at site was carried out in the month of December 2019 to February 2020, during this season, ground water table was varies at each bore location (by considering the level difference) 3.00m depth from ground level at land area. Details of water level encountered in each bore location was indicated in each bore log sheets.

3.0 LABORATORY INVESTIGATIONS

3.1 GENERAL

The selected disturbed soil and rock core samples meant for testing were transported to M/s Geo Structura laboratory, Kollam. The laboratory tests were conducted as per relevant parts of Indian Standards. Tests were performed based on the laboratory testing schedule approved by Client. A summary of laboratory tests carried out is shown below and complete testing results are presented along with bore logs.

3.2 MOISTURE CONTENT

To obtain the natural moisture content of soil specimen at various depth were carried out as per IS 2720 (Part 2/Section 1) by oven drying method. The results have been presented in the summarized data sheet.

3.3 GRAIN SIZE ANALYSIS

To obtain information concerning the type of soil met at various depths and to classify each soil strata, grain size analysis were carried out as per IS: 2720 (Part-IV). The results have been presented in the summarized data sheet.

3.ATTERBURGS LIMITS

Soil consistency refers to the resistance of the soil offered against forces that tend to deform or rupture the soil aggregate. Consistency limits indicate the soil moisture content limits for various states of consistency. The consistency limits include Liquid Limit (L.L), Plastic Limit (P.L), and Shrinkage Limit (S.L). The difference between the numerical values of liquid limit and plastic limit of the soil is called the Plasticity Index (P.I). It indicates the range of moisture content over which the soil exhibits plasticity. It is determined as per the procedure laid down in IS: 2720 (Part-IV). Plasticity index was computed. Results of liquid limit and plasticity index have been reported in the summarized data sheets.

3.5 SPECIFIC GRAVITY

The specific gravity of the soil sample is the ratio of the mass of a given volume of soil sample in air to the mass of an equal volume of water at 27 $\,^{0}$ C. Specific gravity of soil sample was determined as per the provisions of IS: 2720 (Part –III). Specific gravity of soil sample obtained during the test has been reported in the summarized data sheet.

3.6 UNCONFINED COMPRESSIVE STRENGTH TEST

The undrained shear strength of clay and silty clay soil was determined by IS 2720 (Part X). The determination of unconfined compressive strength of undisturbed and remolded soil was limited to cohesive or naturally or artificially cemented soil. Soil with inclined fissures, sand and silt lenses and slickenside has a tendency to slide prematurely along these weaker planes in unconfined compression tests. The unconfined compressive strength is considered to be equal to the load at which failure occurs divided by the cross sectional area of the sample at the time of failure. In clayey soil the undrained conditions are expected to be the lower design limits (i.e. the minimum factor of safety), the undrained shear strength (i,e Cohesion) governs the behavior of clay. This undrained shear strength is approximately equal to half the unconfined compressive strength of undisturbed samples.

3.7 DIRECT SHEAR TEST

The direct shear test was performed in accordance with IS 2720 (Part XIII). Apparent cohesion or angle of internal friction was obtained by conducting this test. Shear strength attributes to friction required a normal force and the soil material exhibit friction characteristics and multiple contact areas. In dense soils the individual soil grains can interlocks when sliding occurs the individual grains lifted over one another against the normal stress, there for the force required to overcome particle interlock is proportional to the normal stress. The angle of internal friction represent the sum of sliding friction and interlocking, it is the function of density, roundness, angularity and particle size.

4.0 FOUNDATION RECOMMENDATIONS

4.1 GENERAL

The soil investigation of this project is being designed in accordance with the Indian Standard Specifications. Total 10 bore holes were investigated in this project & Hard rocks were available at reasonable depth.

Axial compression load is assumed to be carried entirely in the bedrock, by combined rock socket side friction and end bearing at the base of the rock socket. The contribution of the overburden soil to piles axial capacity is neglected the average soil properties for the calculation of pile capacities listed in table 4.1.

Pile length shall take according to the availability of hard rock for each bore holes and according to laboratory results and SPT N Value. The safe load capacity of each pile was provided in accordance with IS Specifications.

4.2 BORE HOLE DESCRIPTION

1st and 10th bore holes were taken at each sides of river and other bore holes were at river. In BH1, very loose fine sand/riverine alluvium was found as top soil up to 0.8m depth. Soft clay loam[silty clay & sandy clay] was found below up to 5.1m depth with SPT N of 1,16 and 15 at 1.5m,3m and 4.5m depth. Fine sand was found below up o 8.5m and very soft soil was found from 8.5m to 12.5m depth. Loose to dense sandy loam [Clayey sand] was found up to 0.2m thick boulder bed at 28.2m depth. SPT N at 6m, 7.5m, 9m, 10.5m, 12m, 13.5m, 15m, 17m, 19m and 25m depth was 7, 8, 3, 3, 2, 18, 23, 35, 39, 51 and more than 50 at 23m and 25m depth respectively. Dense clayey sand was found from 28.4m to 33.2m depth with SPT N of 49 at 32m depth. Soft rock followed by hard rock[Core recovery 118cm] was available at 33.2m and 33.6m depth respectively. Bore hole terminated at 36.6m depth.

In BH2, very loose fine sand/riverine alluvium was found as top soil up to 0.8m depth from river bed. Soft clay loam[silty clay & sandy clay] was found below up to 8.9 m depth with SPT N of 3,10,8 and 8 at 1.5m,3m and 4.5m depth and 5t 6m and 7.5mdepth respectively. Lateritic clayey sand was found below, up 24.48m and hard sandy clayey soil was found from 24.4m to 27m depth. Dense sandy loam [Clayey sand] was found up soft rock bed at 32.8m. SPT N at 9m,10.5m,12m,13.5m,15m,17m,19m,21m and 23m depth was 12,14,16,22,26,39,32,38 and 41,45 at 28m & more than 50 at 25m,31m and 32m depth and 25m depth respectively. Soft rock followed

by hard rock[Core recovery 225cm] was available at 32.8m and 33.7m depth respectively. Bore hole terminated at 36.7m depth.

In BH3, very loose fine sand/riverine alluvium was found as top soil up to 0.9m depth from river bed. Very loose lateritic clayey sand was found up to 4.1m depth and very soft clay was found between 4.1m and 8.7m. medium soft sand clay was found below up to 12.6m. loose to dense sand and sandy loam was found from 12.6m and 30.8m depth. SPT N at 1.5m, 3m, 4.5m, 6m, 7.5m, 9m, 10.5m, 12m, 13.5m, 15m, 17m, 19m, 21m, 23m, 25m and 28m depth was 5, 6, 2, 4, 4, 22, 25, 32, 27, 31, 45, 26, 27, 33, 50 and & more than 50 at 31m respectively. Weathered fine sand was found from 30.8m and 32.3m depth. Soft rock followed by hard rock[Core recovery 162cm] was available at 32.3m and 33.1m depth respectively. Bore hole terminated at 36.1m depth.

In BH4, very loose lateritic sand and sandy or silty clay was found upto 8.8m depth from river bed with SPT N of 2,3,2,3 and 3 at 1.5m, 3m, 4.5m, 6m and 7.5m depth. Lateritic sand or sandy clay was found from 8.8m to 19m depth. Very dense to dense laterite was found below, up to 30.7m depth. Soft rock was at 20.7m and hard rock available at 31.3m[Core recovery 182cm].SPT N of 28,42,50,45,48,41,46,45,50 and 50 at 9m, 10.5m, 12m, 13.5m, 15m, 17m, 19m, 21m, 23m and 25m depth respectively. Bore hole terminated at 34.3 depth.

In BH5, Lateritic clayey sand was found up to 3.8m depth from river bed with SPT N of 3 and 5 at 1.5m and 3m depth respectively. Very soft silty clay layer was found below, up to 9m depth with SPT N at 6m and 7.5m depth was 2. Loose lateritic clayey sand was found below, up to 14.9m depth with SPT N of 15,14,11 and 14 at 9m, 10.5m, 12m and 13.5m depth respectively. Dense to very dense lateritic sand and sandy loam was extended below, up to weathered rock bed at 31.2m depth. SPT N was 39,33,40,22,33,50 and 45 at 15m, 17m, 19m, 21m, 23m, 25m and 28m depth respectively. Soft rock followed by hard rock [Core recovery 194cm] was available at 31.6m and 32.1m depth. Bore hole terminated at 35.1m depth.

In BH6, Lateritic clayey sand was found upto 4.3m depth from river bed with SPT N of 4 at 1.5m depth. Very soft sandy clay layer was found below, up to 8.6m depth with SPT N at 4.5m,6m,7.5m and 9m depth was 6,1,1 and 9 respectively. Loose lateritic clayey sand /silty sand was found below, up to 31.8m depth with SPT N of 15,21,30,36,36,46,42 and 32 at 10.5m, 12m, 135.m, 15m, 17m ,19m 21m and 23m depth and more than 50 at 25m,27m and 29m depth respectively. Weathered rock bed was found at 32.8m depth. Soft rock followed by hard rock [Core recovery 205cm] was available at 33.2m and 33.9m depth. Bore hole terminated at 36.9m depth.

In BH7, Lateritic clayey sand was found upto 3.1m depth from river bed with SPT N of 6 at 1.5m depth. Very soft sandy clay with SPT N of 1,1,2and 8 at 4.5m, 6m, 7.5m and 9m depth respectively. Loose to dense lateritic clayey sand /silty sand was found below, up to 29.4m depth with SPT N of 16,16,21,34,39,39,36,41 and 52 at 10.5m, 12m, 13.5.m, 15m, 17m, 19m 21m, 23m and 25m depth and more than 50 at 27m and 29m depth respectively. Weathered rock bed was found at 30.9m depth. Soft rock followed by hard rock [Core recovery 185cm] was available at 33.3m and 34m depth respectively. Bore hole terminated at 37m depth.

In BH8, Lateritic clayey sand was found from upto 4.1m depth from river bed with SPT N of 7 at 3m depth. Very soft sandy clay extended up to 5.9m and up to 8m depth respectively with SPT N of 5,2,3 and 5 at 4.5m, 6m, 7.5m and 9m depth respectively. Very soft to soft clay was found below up to 12.6m with SPT N at 10.5m and 12m depth was 21 and 24 respectively. Loose to dense lateritic clayey sand /silty sand was found below, up to 32.1m depth with SPT N of 22,41,38,47,46,45,50,26 and 47 at 13.5.m, 15m, 17m,19m 21m, 23m 25m, ,27m and 29m depth respectively. Weathered rock bed was found at 32.1m depth. Soft rock followed by hard rock [Core recovery 174cm] was available at 32.8m and 33m depth respectively. Bore hole terminated at 36m depth.

In BH9, Loose riverine alluvium found up to 2.8m depth from river bed with SPT N at 1.5m and 3m was 7 and 8 respectively. Lateritic clayey sand was found from 2.8m to 5.6m depth with SPT N of 6 at 4.5m and 3,4, and 3 at 6m, 7.5m and 9m depth respectively. Very soft silty clay was extended from 5.6m up to 9.7m depth. Loose to dense lateritic clayey sand and sand was found upto 25m depth. Medium soft silty clay (Kaolin clay) was found up to soft rock bed at 31.8m with SPT N of 32 and 33 at 28m and 31m depth respectively. Hard rock[Core recovery 200cm] available at 32.6m.Bore hole terminated at 35.6m depth.

In BH10, very loose lateritic sand /silty clay was found at alternate layers up to 10.2m from ground level with SPT N of 7,6,1,2,3 and 3 at 1.5m, 3m, 4.5m, 6m,7.5m and 9m depth. Lateritic clayey sand or sandy clay was found from 10.2 m to 15.6m depth with SPT N of 28,24,21 and 24 at 10.5m, 12m, 13.5m, 15m depth respectively. Very dense to dense medium sand was found below, up to 24.8m depth with SPT N of 49 at 17m and 50 or more than 50 at 19m, 21m and 23m depth.1.5m thick hard laterite layer was found 24.8m depth below, were, SPT hammer rebounded. Medium hard silty clay was found between 26.3m and 32.6m depth with SPT N at 28m and 31m was 32 and 29 respectively. Soft rock was at 32.6m and hard rock available at 32.9m[Core recovery 194cm].Bore hole terminated at 35.9m depth.

4.3 TYPE OF FOUNDATION

Provide pile foundation resting over hard rock (Core recovery >50%) at each pier location as the foundation of regulator bridge & should be provided by angering the pile into rock bed.

Table 4.1 Minimum length of pile at bore locations

Bore hole	1	2	3	4	5	6	7	8	9	10
Pile lengt	h									
(m)	>33.6m	33.7	33.5	31.5	32.5	34.5	34	33.5	33	33.0

Load carrying capacity of individual piles in each bore locations was tabulated here.

Table 4.2 Load Carrying Capacity at Bore locations

Pile	Safe Axial	Safe latera	al capacity
	m)capacity (T	Normal Load	dSeismic Lo
0.60	83	9	7
0.70	110	14	12
0.80	145	16	14
1.00	227	21	17
1.20	320	24	22

5.0 LIMITATIONS & UNIFORMITY CONDITIONS

This report presents geotechnical recommendations for the construction of regulator across Kadalundi river at Moozhikkal Kadavu near Palathingal between Thirurangadi municipality and Moonniyur panchayath, Malappuram If changes occur in the nature or design of the project, we should be allowed to review this report and provide additional recommendations.. The conclusions and recommendations contained in this report are solely professional opinions .We strived to perform our professional services in accordance with generally accepted geotechnical engineering principles and practices currently employed in the area.

This report is based upon field and other conditions discovered at the time of report preparation. We developed this report with limited subsurface exploration data. We assumed that our subsurface exploration data is representative of the actual subsurface conditions across the site.

We determined the lines designating the interface between layers on the exploration logs using visual observations. The transition between the materials may be abrupt or gradual. The exploration logs contain information concerning samples recovered, indications of the presence of various materials such as clay, sand, silt, rock, existing fill, etc. The field logs also contain our interpretation of the subsurface conditions between sample locations. Therefore, the logs contain both factual and interpretative Information. Our recommendations are based on the contents of the final logs, which represent our interpretation of the field logs.

GEOTECHNICAL BORING LOG

: Soil investigation work for the construction of regulator across Kadalundi river at Moozhikkal Kadavu near Palathingal between Name of Project:

Thirurangadi Municipality and Moonniyur Panchayath, Malappuram

: The Executive Engineer, Minor Irrigation Division, Malapuuram-676505

Contractor : Jamshad Naseeri P K Site Location : Palathingal-Parapanagadi site, Malappuram

BORING/DRILLING DATA

Bore Hole No : **1**(Land) **: 21-12-2019** Ground water level : 5.200 m Date of Commence

: Rotary Drilling Type of boring Date of completion : 26-12-2019Reduced Level Surface : 2.812 m

Tungston carbide bit drilling : 36.60 m Diamond carbide bit drilling (m) : 3.00 m : 0.60 m Termination depth(m) (m)

Notations: DS/UDS-Disturbed/Undisturbed sample, SPT - Standard penetration test
